GreenNest Nursery

A clean, responsive landing page for a local plant nursery — built entirely with vanilla HTML, CSS, and JavaScript. No frameworks, no dependencies, no build step required.

Mobile View

GreenNest on Mobile

Project Structure

```
greennest/
    index.html     # Page structure and content
    style.css      # All visual styling and responsive layout
    script.js      # Plant filtering + "Say Hello" interactivity
    README.md      # Project documentation
```

How to Run Locally

No installs. No build process. Just open and go.

Option 1 — Open directly in your browser

```
# macOS
open index.html

# Linux
xdg-open index.html

# Windows (PowerShell)
start index.html
```

Option 2 — Serve with a local dev server *(recommended to avoid any CORS quirks with images)*

```
# Python 3
python3 -m http.server 8080

# Node.js
npx serve .

# VS Code
# Install the "Live Server" extension    right-click index.html    "Open with Live Serve
```

Then visit `http://localhost:8080` in your browser.

> No npm install. No compilation. No environment setup. It just works.

What It Does

GreenNest is a single-page website for a fictional local plant nursery. Here's a breakdown of every feature:

Hero Section

A full-bleed background image overlaid with a dark gradient creates an elegant, atmospheric header. The headline scales fluidly using `clamp()` so it always reads well at any screen size.

```
/* style.css */
.hero {
  min-height: 70vh;
  background:
    linear-gradient(to bottom, rgba(10, 20, 12, 0.38), rgba(10, 20, 12, 0.38)),
    url("https://images.unsplash.com/...") center/cover no-repeat;
  color: #f8fff7;
}

.hero-content h2 {
  font-size: clamp(2rem, 5vw, 3.4rem);
  line-height: 1.08;
}
```

The nav sits at the top with the brand logo on the left and an outlined **"Visit Us"** anchor link on the right, which smooth-scrolls to the contact section.

Plant Grid

Six plant cards are laid out in a responsive CSS Grid. The grid automatically adjusts columns based on available width using `auto-fit` and `minmax`, so no breakpoint juggling is needed.

```
/* style.css */
.plant-grid {
  display: grid;
  grid-template-columns: repeat(auto-fit, minmax(220px, 1fr));
  gap: 1rem;
}
```

Each card has a hover lift effect with a subtle green-tinted shadow:

```
.plant-card:hover {
  transform: translateY(-3px);
  box-shadow: 0 16px 26px rgba(18, 33, 19, 0.09);
}
```

Category Filtering

Four filter buttons — **All**, **Indoor**, **Flowering**, **Easy Care** — let visitors narrow the plant grid. Each plant card carries a `data-category` attribute that can hold multiple categories:

```
<!-- index.html -->
<article class="plant-card" data-category="indoor easy">
  ...
</article>

<article class="plant-card" data-category="flowering easy">
  ...
</article>
```

The JavaScript reads the active filter and shows or hides cards by checking whether the card's `data-category` string contains the selected value:

```
// script.js
filterButtons.forEach((button) => {
  button.addEventListener("click", () => {
    filterButtons.forEach((btn) => btn.classList.remove("active"));
    button.classList.add("active");

    const filter = button.dataset.filter;

    plantCards.forEach((card) => {
      if (filter === "all" || card.dataset.category.includes(filter)) {
        card.style.display = "block";
      } else {
        card.style.display = "none";
```

```
    }
  });
 });
});
```

The active filter button is highlighted using a soft green tint:

```
/* style.css */
.filter-btn.active {
  background: #e5f3e4;
  border-color: #c0dfbf;
  color: #1f5a23;
}
```

Contact / "Say Hello" Section

A centered contact card displays nursery hours and address. Clicking the **"Say Hello"** button reveals a friendly confirmation message — implemented with an `aria-live` region so screen readers also announce the change.

```
<!-- index.html -->
<button id="helloBtn" class="btn">Say Hello</button>
<p id="helloMsg" class="hello-msg" aria-live="polite"></p>
```

```
// script.js
helloBtn.addEventListener("click", () => {
  helloMsg.textContent = "Thanks for visiting GreenNest. See you soon!";
});
```

Responsive Design

The layout adapts cleanly to mobile screens (≤ 640px). The hero content padding compresses and the plant card images reduce height slightly to maintain visual balance:

```
/* style.css */
@media (max-width: 640px) {
  .hero-content {
    padding: 4.5rem 0 4rem;
  }

  .plant-card img {
    height: 190px;
  }
}
```

The plant grid itself requires no breakpoint — `auto-fit` handles column collapsing automatically.

What It Uses

Technology	Role
HTML5	Semantic page structure (`<header>` , `<main>` , `<section>` , `<article>` , `<nav>`)
CSS3	Layout, theming, transitions, and responsive design
CSS Custom Properties	Global design tokens for colors and border radius
CSS Grid	Responsive plant card layout via `auto-fit` + `minmax`
CSS Flexbox	Nav bar and section header alignment
CSS `clamp()`	Fluid typography that scales between breakpoints
Vanilla JavaScript	Category filtering and interactive "Say Hello" feature
Google Fonts	`DM Serif Display` (headings) + `Manrope` (body text)
Unsplash	Remote plant imagery via URL

Design Tokens

All key colors are centralized as CSS custom properties, making the theme easy to adjust in one place:

```
/* style.css */
:root {
```

```
  --bg: #f5f7f1;
  --paper: #ffffff;
  --text: #243126;
  --muted: #5c6e5f;
  --accent: #2f7d32;
  --accent-dark: #245f27;
  --line: #dce5d9;
  --radius: 16px;
}
```

Future Improvements

Functionality

- **Search bar** — let users type a plant name to filter results in real time, complementing the category buttons
- **Shopping cart** — add a "Buy" or "Wishlist" button to each plant card with a cart counter in the nav
- **Plant detail modal** — clicking a card opens a larger overlay with care tips, sunlight needs, watering schedule, and price
- **Contact form** — replace or supplement the "Say Hello" button with a real enquiry form (name, email, message) connected to a backend or a service like Formspree
- **More categories** — extend `data-category` tags to support Outdoor, Rare, Pet-Friendly, etc.

Design & UX

- **Smooth filter transitions** — animate cards fading/scaling out on filter change using CSS transitions instead of abrupt `display: none`
- **Dark mode** — add a toggle that switches the CSS custom properties to a dark palette
- **Loading skeleton** — show placeholder cards while images load, especially on slow connections

- **Sticky header** — make the nav bar stick to the top on scroll with a subtle frosted-glass backdrop

Performance & Accessibility

- **Self-host fonts** — download Google Fonts files and serve them locally to avoid the external network dependency
- **Lazy-load images** — add `loading="lazy"` to all `<img>` tags to defer off-screen image loading
- **Alt text audit** — ensure every plant image has a descriptive, unique alt text (already done here — keep it up as new plants are added)
- **Keyboard navigation** — make filter buttons and the "Say Hello" action fully operable via keyboard, including visible focus rings
- **ARIA roles** — add `aria-live` announcements for filter results count (e.g., "Showing 3 of 6 plants")

Developer Experience

- **CSS variables for spacing** — add spacing tokens (e.g., `--space-sm`, `--space-lg`) alongside the color tokens for consistent rhythm
- **Component-based refactor** — migrate to a framework like Astro, Next.js, or SvelteKit when the site grows beyond a single page
- **CMS integration** — move plant data (name, description, image, categories) into a headless CMS like Sanity or Contentful so non-technical staff can update inventory without touching code
- **Automated testing** — add end-to-end tests (Playwright or Cypress) to verify filtering behavior and contact interactions after every change
